

Atlas PTT provides users with the “One to many” voice features of traditional PTT (Two-way radio) services but without the infrastructural cost nor the dedicated hardware. Atlas PTT operates using an app running on a compatible Android smartphone and a data connection (GPRS*, 3G, 4G & WiFi).

Atlas PTT provides organisations who have a definite need for PTT/PoC functions with a simple way for many people to talk as a group without range or geographic limitations.

Atlas PTT supports up to 64 channels per system and users per channel is only limited by server RAM. With the active talker display, all users can visually see who is talking even when the app is not in the foreground. An active user list for the current group/channel and all users is also easily displayed.

Overview

- PTT/PoC for Smartphones
- Operates over GPRS*, 3G, 4G & WiFi Data
- Connect people without special hardware
- Up to 64 channels
- Integration with dedicated PTT buttons
- Cloud or On-Site system deployment
- Active users list
- Easily switch between channels
